Classification of Recommendations and Levels of Evidence

		SIZE OF TREATMENT EFFECT				
		CLASS I <i>Benefit >>> Risk</i> Procedure/Treatment SHOULD be performed/administered	CLASS IIa <i>Benefit >> Risk</i> Additional studies with <i>focused objectives needed</i> IT IS REASONABLE to perform procedure/administer treatment	CLASS IIb <i>Benefit ≥ Risk</i> Additional studies with <i>broad objectives needed; additional registry data would be helpful</i> Procedure/Treatment MAY BE CONSIDERED	CLASS III <i>No Benefit</i> or CLASS III <i>Harm</i>	
				Procedure/ Test	Treatment	
				COR III: No benefit	No Proven Benefit	
				COR III: Harm	Excess Cost w/o Benefit or Harmful	
ESTIMATE OF CERTAINTY (PRECISION) OF TREATMENT EFFECT	LEVEL A Multiple populations evaluated* Data derived from multiple randomized clinical trials or meta-analyses	<ul style="list-style-type: none"> Recommendation that procedure or treatment is useful/effective Sufficient evidence from multiple randomized trials or meta-analyses 	<ul style="list-style-type: none"> Recommendation in favor of treatment or procedure being useful/effective Some conflicting evidence from multiple randomized trials or meta-analyses 	<ul style="list-style-type: none"> Recommendation's usefulness/efficacy less well established Greater conflicting evidence from multiple randomized trials or meta-analyses 	<ul style="list-style-type: none"> Recommendation that procedure or treatment is not useful/effective and may be harmful Sufficient evidence from multiple randomized trials or meta-analyses 	
	LEVEL B Limited populations evaluated* Data derived from a single randomized trial or nonrandomized studies	<ul style="list-style-type: none"> Recommendation that procedure or treatment is useful/effective Evidence from single randomized trial or nonrandomized studies 	<ul style="list-style-type: none"> Recommendation in favor of treatment or procedure being useful/effective Some conflicting evidence from single randomized trial or nonrandomized studies 	<ul style="list-style-type: none"> Recommendation's usefulness/efficacy less well established Greater conflicting evidence from single randomized trial or nonrandomized studies 	<ul style="list-style-type: none"> Recommendation that procedure or treatment is not useful/effective and may be harmful Evidence from single randomized trial or nonrandomized studies 	
	LEVEL C Very limited populations evaluated* Only consensus opinion of experts, case studies, or standard of care	<ul style="list-style-type: none"> Recommendation that procedure or treatment is useful/effective Only expert opinion, case studies, or standard of care 	<ul style="list-style-type: none"> Recommendation in favor of treatment or procedure being useful/effective Only diverging expert opinion, case studies, or standard of care 	<ul style="list-style-type: none"> Recommendation's usefulness/efficacy less well established Only diverging expert opinion, case studies, or standard of care 	<ul style="list-style-type: none"> Recommendation that procedure or treatment is not useful/effective and may be harmful Only expert opinion, case studies, or standard of care 	
Suggested phrases for writing recommendations		should is recommended is indicated is useful/effective/beneficial	is reasonable can be useful/effective/beneficial is probably recommended or indicated	may/might be considered may/might be reasonable usefulness/effectiveness is unknown/unclear/uncertain or not well established	COR III: No Benefit is not recommended is not indicated should not be performed/administered/ other is not useful/beneficial/ effective	COR III: Harm potentially harmful causes harm associated with excess morbidity/mortality should not be performed/administered/ other
Comparative effectiveness phrases†		treatment/strategy A is recommended/indicated in preference to treatment B treatment A should be chosen over treatment B	treatment/strategy A is probably recommended/indicated in preference to treatment B it is reasonable to choose treatment A over treatment B			

A recommendation with Level of Evidence B or C does not imply that the recommendation is weak. Many important clinical questions addressed in the guidelines do not lend themselves to clinical trials. Although randomized trials are unavailable, there may be a very clear clinical consensus that a particular test or therapy is useful or effective.

*Data available from clinical trials or registries about the usefulness/efficacy in different subpopulations, such as sex, age, history of diabetes, history of prior myocardial infarction, history of heart failure, and prior aspirin use.

†For comparative effectiveness recommendations (Class I and IIa; Level of Evidence A and B only), studies that support the use of comparator verbs should involve direct comparisons of the treatments or strategies being evaluated.

The Society for Cardiovascular
Angiography and Interventions

Introduction

The PCI guideline reflects the growth of knowledge in the field and parallels the many advances and innovations in the field of interventional cardiology, including primary PCI, BMS and DES, IVUS and physiologic assessments of stenosis, and newer antiplatelet and anticoagulant therapies. This guideline addresses ethical aspects of PCI, vascular access considerations, CAD revascularization, including hybrid revascularization, revascularization before noncardiac surgery, optical coherence tomography, advanced hemodynamic support devices, no-reflow therapies, and vascular closure devices.

Most of this document is organized according to “patient flow,” consisting of preprocedural considerations, procedural considerations, and postprocedural considerations.

The STEMI, PCI, and CABG guidelines were written concurrently, with additional collaboration with the SIHD guideline writing committee, allowing for greater collaboration on topics such as PCI in STEMI and revascularization strategies in patients with CAD.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Guideline for CABG

CAD Revascularization

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

CAD Revascularization

Heart Team Approach to Revascularization Decisions

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Heart Team Approach to Revascularization Decisions

A Heart Team approach to revascularization is recommended in patients with unprotected left main or complex CAD.

Calculation of the STS and SYNTAX scores is reasonable in patients with unprotected left main and complex CAD.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

CAD Revascularization

Revascularization to Improve Survival

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Revascularization to Improve Survival: Left Main CAD Revascularization

CABG to improve survival is recommended for patients with significant ($\geq 50\%$ diameter stenosis) left main CAD.

PCI to improve survival is reasonable as an alternative to CABG in selected stable patients with significant ($\geq 50\%$ diameter stenosis) unprotected left main CAD with: 1) anatomic conditions associated with a low risk of PCI procedural complications and a high likelihood of a good long-term outcome (e.g., a low SYNTAX score [≤ 22], ostial or trunk left main CAD); and 2) clinical characteristics that predict a significantly increased risk of adverse surgical outcomes (e.g., STS-predicted risk of operative mortality $\geq 5\%$).

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Revascularization to Improve Survival: Left Main CAD Revascularization (cont.)

PCI to improve survival is reasonable in patients with UA/NSTEMI when an unprotected left main coronary artery is the culprit lesion and the patient is not a candidate for CABG.

PCI to improve survival is reasonable in patients with acute STEMI when an unprotected left main coronary artery is the culprit lesion, distal coronary flow is TIMI (Thrombolysis In Myocardial Infarction) grade <3, and PCI can be performed more rapidly and safely than CABG.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Revascularization to Improve Survival: Left Main CAD Revascularization (cont.)

PCI to improve survival may be reasonable as an alternative to CABG in selected stable patients with significant ($\geq 50\%$ diameter stenosis) unprotected left main CAD with: 1) anatomic conditions associated with a low to intermediate risk of PCI procedural complications and an intermediate to high likelihood of good long-term outcome (e.g., low-intermediate SYNTAX score of < 33 , bifurcation left main CAD); and 2) clinical characteristics that predict an increased risk of adverse surgical outcomes (e.g., moderate-severe chronic obstructive pulmonary disease, disability from previous stroke, or previous cardiac surgery; STS-predicted risk of operative mortality $> 2\%$).

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Revascularization to Improve Survival: Left Main CAD Revascularization (cont.)

Harm

PCI to improve survival **should not be performed** in stable patients with significant ($\geq 50\%$ diameter stenosis) unprotected left main CAD who have unfavorable anatomy for PCI and who are good candidates for CABG.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Revascularization to Improve Survival: Non-Left Main CAD Revascularization

CABG to improve survival is beneficial in patients with significant ($\geq 70\%$ diameter) stenoses in 3 major coronary arteries (with or without involvement of the proximal LAD artery) or in the proximal LAD plus 1 other major coronary artery.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Revascularization to Improve Survival: Non-Left Main CAD Revascularization (cont.)

CABG or PCI to improve survival is beneficial in survivors of sudden cardiac death with presumed ischemia-mediated ventricular tachycardia caused by a significant ($\geq 70\%$ diameter) stenosis in a major coronary artery.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

American
Heart
Association

The Society for Cardiovascular
Angiography and Interventions

Revascularization to Improve Survival: Non-Left Main CAD Revascularization (cont.)

CABG to improve survival is reasonable in patients with significant ($\geq 70\%$ diameter) stenoses in 2 major coronary arteries with severe or extensive myocardial ischemia (e.g., high-risk criteria on stress testing, abnormal intracoronary hemodynamic evaluation, or $>20\%$ perfusion defect by myocardial perfusion stress imaging) or target vessels supplying a large area of viable myocardium.

CABG to improve survival is reasonable in patients with mild-moderate left ventricular systolic dysfunction (ejection fraction 35% to 50%) and significant ($\geq 70\%$ diameter stenosis) multivessel CAD or proximal LAD coronary artery stenosis, when viable myocardium is present in the region of intended revascularization.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Revascularization to Improve Survival: Non-Left Main CAD Revascularization (cont.)

CABG with a LIMA graft to improve survival is reasonable in patients with a significant ($\geq 70\%$ diameter) stenosis in the proximal LAD artery and evidence of extensive ischemia.

It is reasonable to choose CABG over PCI to improve survival in patients with complex 3-vessel CAD (e.g., SYNTAX score > 22) with or without involvement of the proximal LAD artery who are good candidates for CABG.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

American
Heart
Association

The Society for Cardiovascular
Angiography and Interventions

Revascularization to Improve Survival: Non-Left Main CAD Revascularization (cont.)

CABG is probably recommended in preference to PCI to improve survival in patients with multivessel CAD and diabetes mellitus, particularly if a LIMA graft can be anastomosed to the LAD artery.

The usefulness of CABG to improve survival is uncertain in patients with significant ($\geq 70\%$) stenoses in 2 major coronary arteries not involving the proximal LAD artery and without extensive ischemia.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Revascularization to Improve Survival: Non-Left Main CAD Revascularization (cont.)

The usefulness of PCI to improve survival is uncertain in patients with 2- or 3-vessel CAD (with or without involvement of the proximal LAD artery) or 1-vessel proximal LAD disease.

CABG might be considered with the primary or sole intent of improving survival in patients with SIHD with severe LV systolic dysfunction (EF<35%) whether or not viable myocardium is present.

The usefulness of CABG or PCI to improve survival is uncertain in patients with previous CABG and extensive anterior wall ischemia on noninvasive testing.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

The Society for Cardiovascular
Angiography and Interventions

Revascularization to Improve Survival: Non-Left Main CAD Revascularization (cont.)

CABG or PCI **should not be performed** with the primary or sole intent to improve survival in patients with SIHD with 1 or more coronary stenoses that are not anatomically or functionally significant (e.g., <70% diameter non-left main coronary artery stenosis, fractional flow reserve >0.80, no or only mild ischemia on noninvasive testing), involve only the left circumflex or right coronary artery, or subtend only a small area of viable myocardium.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Revascularization to Improve Symptoms

CABG or PCI to improve symptoms is beneficial in patients with 1 or more significant ($\geq 70\%$ diameter) coronary artery stenoses amenable to revascularization and unacceptable angina despite GDMT.

CABG or PCI to improve symptoms is reasonable in patients with 1 or more significant ($\geq 70\%$ diameter) coronary artery stenoses and unacceptable angina for whom GDMT cannot be implemented because of medication contraindications, adverse effects, or patient preferences.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Revascularization to Improve Symptoms (cont.)

PCI to improve symptoms is reasonable in patients with previous CABG, 1 or more significant ($\geq 70\%$ diameter) coronary artery stenoses associated with ischemia, and unacceptable angina despite GDMT.

It is reasonable to choose CABG over PCI to improve symptoms in patients with complex 3-vessel CAD (e.g., SYNTAX score >22), with or without involvement of the proximal LAD artery who are good candidates for CABG.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Revascularization to Improve Symptoms (cont.)

CABG to improve symptoms might be reasonable for patients with previous CABG, 1 or more significant ($\geq 70\%$ diameter) coronary artery stenoses not amenable to PCI, and unacceptable angina despite GDMT.

Transmyocardial laser revascularization performed as an adjunct to CABG to improve symptoms may be reasonable in patients with viable ischemic myocardium that is perfused by arteries that are not amenable to grafting.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Revascularization to Improve Symptoms (cont.)

CABG or PCI to improve symptoms **should not be performed** in patients who do not meet anatomic ($\geq 50\%$ left main or $\geq 70\%$ non-left main stenosis) or physiologic (e.g., abnormal fractional flow reserve) criteria for revascularization.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

The Society for Cardiovascular
Angiography and Interventions

CAD Revascularization

Dual Antiplatelet Therapy Compliance and Stent Thrombosis

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Dual Antiplatelet Therapy Compliance and Stent Thrombosis

PCI with coronary stenting (BMS or DES) **should not be performed** if the patient is not likely to be able to tolerate and comply with DAPT for the appropriate duration of treatment based on the type of stent implanted.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

CAD Revascularization

Hybrid Coronary Revascularization

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Hybrid Coronary Revascularization

Hybrid coronary revascularization (defined as the planned combination of LIMA-to-LAD artery grafting and PCI of ≥ 1 non-LAD coronary arteries) is reasonable in patients with 1 or more of the following:

- a. Limitations to traditional CABG, such as a heavily calcified proximal aorta or poor target vessels for CABG (but amenable to PCI);
- b. Lack of suitable graft conduits;
- c. Unfavorable LAD artery for PCI (i.e., excessive vessel tortuosity or chronic total occlusion).

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Hybrid Coronary Revascularization (cont.)

Hybrid coronary revascularization (defined as the planned combination of LIMA-to-LAD artery grafting and PCI of ≥ 1 non-LAD coronary arteries) may be reasonable as an alternative to multivessel PCI or CABG in an attempt to improve the overall risk-benefit ratio of the procedures.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Preprocedural Considerations

Radiation Safety

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Radiation Safety

Cardiac catheterization laboratories should routinely record relevant available patient procedural radiation dose data (e.g., total air kerma at the international reference point [$K_{a,r}$], air kerma air product [P_{KA}], fluoroscopy time, number of cine images), and should define thresholds with corresponding follow-up protocols for patients who receive a high procedural radiation dose.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

American
Heart
Association

The Society for Cardiovascular
Angiography and Interventions

Preprocedural Considerations

Contrast-Induced Acute Kidney Injury

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Contrast-Induced Acute Kidney Injury

Patients should be assessed for risk of contrast-induced AKI before PCI.

Patients undergoing cardiac catheterization with contrast media should receive adequate preparatory hydration.

In patients with CKD ($\text{Crcl} < 60 \text{ mL/min}$), the volume of contrast media should be minimized.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

American
Heart
Association

The Society for Cardiovascular
Angiography and Interventions

Contrast-Induced Acute Kidney Injury (cont.)

Administration of N-acetyl-L-cysteine is **not useful** for the prevention of contrast-induced AKI.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Preprocedural Considerations

Anaphylactoid Reactions

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Anaphylactoid Reactions

Patients with prior evidence of an anaphylactoid reaction to contrast media should receive appropriate steroid and antihistamine prophylaxis before repeat contrast administration.

No Benefit

In patients with a prior history of allergic reactions to shellfish or seafood, anaphylactoid prophylaxis for contrast reaction **is not beneficial**.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

American
Heart
Association

The Society for Cardiovascular
Angiography and Interventions

Preprocedural Considerations

Statin Treatment

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Statin Treatment

Statin-naive patients:

Administration of a high-dose statin is reasonable before PCI to reduce the risk of periprocedural MI.

Patients on chronic statin therapy:

Administration of a high-dose statin is reasonable before PCI to reduce the risk of periprocedural MI.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Preprocedural Considerations

Bleeding Risk

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Bleeding Risk

All patients should be evaluated for risk of bleeding before PCI.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Preprocedural Considerations

PCI in Hospitals Without On-Site Surgical Backup

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

PCI in Hospitals Without On-Site Surgical Backup

Primary PCI is reasonable in hospitals without on-site cardiac surgery, provided that appropriate planning for program development has been accomplished.

Elective PCI might be considered in hospitals without on-site cardiac surgery, provided that appropriate planning for program development has been accomplished and rigorous clinical and angiographic criteria are used for proper patient selection.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

PCI in Hospitals Without On-Site Surgical Backup (cont.)

Primary or elective PCI should **not be performed** in hospitals without on-site cardiac surgery capabilities without a proven plan for rapid transport to a cardiac surgery operating room in a nearby hospital or without appropriate hemodynamic support capabilities for transfer.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Procedural Considerations

Vascular Access

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Vascular Access

The use of radial artery access can be useful to decrease access site complications.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Procedural Considerations

PCI in Specific Clinical Situations

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

PCI in Specific Clinical Situations: UA/NSTEMI

An early invasive strategy (i.e., diagnostic angiography with intent to perform revascularization) is indicated in UA/NSTEMI patients who have refractory angina or hemodynamic or electrical instability (without serious comorbidities or contraindications to such procedures).

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

PCI in Specific Clinical Situations: UA/NSTEMI (cont.)

An early invasive strategy (i.e., diagnostic angiography with intent to perform revascularization) is indicated in initially stabilized UA/NSTEMI patients (without serious comorbidities or contraindications to such procedures) who have an elevated risk for clinical events.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

American
Heart
Association®

The Society for Cardiovascular
Angiography and Interventions

PCI in Specific Clinical Situations: UA/NSTEMI (cont.)

The selection of PCI or CABG as the means of revascularization in the patient with ACS should generally be based on the same considerations as those without ACS.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

The Society for Cardiovascular
Angiography and Interventions

PCI in Specific Clinical Situations: UA/NSTEMI (cont.)

An early invasive strategy (i.e., diagnostic angiography with intent to perform revascularization) is **not recommended** in patients with extensive comorbidities (e.g., liver or pulmonary failure, cancer) in whom

- a. The risks of revascularization and comorbid conditions are likely to outweigh the benefits of revascularization,
- b. There is a low likelihood of ACS despite acute chest pain, or
- c. Consent to revascularization will not be granted regardless of the findings.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

The Society for Cardiovascular
Angiography and Interventions

Procedural Considerations

PCI in Specific Clinical Situations: STEMI

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

PCI in Specific Clinical Situations: STEMI–Coronary Angiography Strategies in STEMI

A strategy of immediate coronary angiography with intent to perform PCI (or emergency CABG) in patients with STEMI is recommended for

a. Patients who are candidates for primary PCI.

b. Patients with severe heart failure or cardiogenic shock who are suitable candidates for revascularization.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

PCI in Specific Clinical Situations: STEMI– Coronary Angiography Strategies in STEMI (cont.)

A strategy of immediate coronary angiography (or transfer for immediate coronary angiography) with intent to perform PCI is reasonable for patients with STEMI, a moderate to large area of myocardium at risk, and evidence of failed fibrinolysis.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

PCI in Specific Clinical Situations: STEMI– Coronary Angiography Strategies in STEMI (cont.)

A strategy of coronary angiography (or transfer for coronary angiography) 3 to 24 hours after initiating fibrinolytic therapy with intent to perform PCI is reasonable for hemodynamically stable patients with STEMI and evidence for successful fibrinolysis when angiography and revascularization can be performed as soon as logistically feasible in this time frame.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

PCI in Specific Clinical Situations: STEMI–Coronary Angiography Strategies in STEMI (cont.)

A strategy of coronary angiography performed before hospital discharge might be reasonable in stable patients with STEMI who did not undergo cardiac catheterization within 24 hours of STEMI onset.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

PCI in Specific Clinical Situations: STEMI– Coronary Angiography Strategies in STEMI (cont.)

No Benefit

A strategy of coronary angiography with intent to perform PCI is **not recommended** in patients with STEMI in whom the risks of revascularization are likely to outweigh the benefits or when the patient or designee does not want invasive care.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

American
Heart
Association®

The Society for Cardiovascular
Angiography and Interventions

Procedural Considerations

PCI in Specific Clinical Situations: Primary PCI of the Infarct Artery

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

PCI in Specific Clinical Situations: STEMI– Primary PCI of the Infarct Artery

Primary PCI should be performed in patients within 12 hours of onset of STEMI.

Primary PCI should be performed in patients with STEMI presenting to a hospital with PCI capability within 90 minutes of first medical contact as a systems goal.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

PCI in Specific Clinical Situations: STEMI–Primary PCI of the Infarct Artery (cont.)

Primary PCI should be performed in patients with STEMI presenting to a hospital without PCI capability within 120 minutes of first medical contact as a systems goal.

Primary PCI should be performed in patients with STEMI who develop severe heart failure or cardiogenic shock and are suitable candidates for revascularization as soon as possible, irrespective of time delay.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

PCI in Specific Clinical Situations: STEMI– Primary PCI of the Infarct Artery (cont.)

Primary PCI should be performed as soon as possible in patients with STEMI and contraindications to fibrinolytic therapy with ischemic symptoms for <12 hours.

Primary PCI is reasonable in patients with STEMI if there is clinical and/or electrocardiographic evidence of ongoing ischemia between 12 and 24 hours after symptom onset.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

PCI in Specific Clinical Situations: STEMI– Primary PCI of the Infarct Artery (cont.)

Primary PCI might be considered in asymptomatic patients with STEMI and higher risk presenting between 12 and 24 hours after symptom onset.

Harm

PCI **should not be performed** in a noninfarct artery at the time of primary PCI in patients with STEMI without hemodynamic compromise.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Delayed or Elective PCI in Patients with STEMI

PCI is reasonable in patients with STEMI and clinical evidence for fibrinolytic failure or infarct artery reocclusion.

PCI is reasonable in patients with STEMI and a patent infarct artery 3 to 24 hours after fibrinolytic therapy.

PCI is reasonable in patients with STEMI who demonstrate ischemia on noninvasive testing.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Delayed or Elective PCI in Patients with STEMI

PCI of a hemodynamically significant stenosis in a patent infarct artery >24 hours after STEMI may be considered as part of an invasive strategy.

PCI of a totally occluded infarct artery >24 hours after STEMI should not be performed in asymptomatic patients with 1- or 2-vessel disease if patients are hemodynamically and electrically stable and do not have evidence of severe ischemia.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

The Society for Cardiovascular
Angiography and Interventions

PCI in Specific Clinical Situations: Cardiogenic Shock

PCI is recommended for patients with acute MI who develop cardiogenic shock and are suitable candidates.

A hemodynamic support device is recommended for patients with cardiogenic shock after STEMI who do not quickly stabilize with pharmacologic therapy.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

PCI in Specific Clinical Situations: Revascularization Before Noncardiac Surgery

For patients who require PCI and who are scheduled for elective noncardiac surgery in the subsequent 12 months, a strategy of balloon angioplasty, or BMS implantation followed by 4 to 6 weeks of DAPT, is reasonable.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

PCI in Specific Clinical Situations: Revascularization Before Noncardiac Surgery

For patients with a DES who must undergo urgent surgical procedures that mandate the discontinuation of DAPT, it is reasonable to continue aspirin if possible and restart the P2Y₁₂ inhibitor as soon as possible in the immediate postoperative period.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

PCI in Specific Clinical Situations: Revascularization Before Noncardiac Surgery

Routine prophylactic coronary revascularization **should not be performed** in patients with stable CAD before noncardiac surgery.

Elective noncardiac surgery **should not be performed** in the 4 to 6 weeks after balloon angioplasty or BMS implantation or the 12 months after DES implantation in patients in whom the P2Y₁₂ inhibitor will need to be discontinued perioperatively.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Procedural Considerations

Coronary Stents

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Coronary Stents

Before implantation of DES, the interventional cardiologist should discuss with the patient the need for and duration of DAPT and the ability of the patient to comply with and tolerate DAPT.

DES is useful as an alternative to BMS to reduce the risk of restenosis in cases in which the risk of restenosis is increased and the patient is likely to be able to tolerate and comply with prolonged DAPT.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

The Society for Cardiovascular
Angiography and Interventions

Coronary Stents (cont.)

Balloon angioplasty or BMS should be used in patients with high bleeding risk, inability to comply with 12 months of DAPT, or with anticipated invasive or surgical procedures within the next 12 months during which time DAPT may be interrupted.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Coronary Stents (cont.)

Harm

PCI with coronary stenting **should not be performed** if the patient is not likely to be able to tolerate and to comply with DAPT.

Harm

DES **should not be implanted** if the patient is not likely to be able to tolerate and comply with prolonged DAPT, or this cannot be determined prior to stent implantation.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Procedural Considerations

Adjunctive Diagnostic Devices

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Fractional Flow Reserve

FFR is reasonable to assess angiographic intermediate coronary lesions (50% to 70% diameter stenosis) and can be useful in guiding revascularization decisions in patients with SIHD.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Intravascular Ultrasound

IVUS is reasonable for the assessment of angiographically indeterminate left main CAD.

IVUS and coronary angiography are reasonable 4 to 6 weeks and 1 year after transplantation to exclude donor CAD, to detect rapidly progressive cardiac allograft vasculopathy, and to provide prognostic information.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Intravascular Ultrasound (cont.)

IVUS is reasonable to determine the mechanism of stent restenosis.

IVUS may be reasonable for the assessment of non-left main coronary arteries with angiographically intermediate coronary stenoses (50% to 70% diameter stenosis).

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Intravascular Ultrasound (cont.)

IVUS may be considered for guidance of coronary stent implantation, particularly in cases of left main coronary artery stenting.

IVUS may be reasonable to determine the mechanism of stent thrombosis.

No Benefit

IVUS for routine lesion assessment **is not recommended** when revascularization with PCI or CABG is not being contemplated.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Procedural Considerations

Adjunctive Therapeutic Devices

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Coronary Atherectomy

Rotational atherectomy is reasonable for fibrotic or heavily calcified lesions that might not be crossed by a balloon catheter or adequately dilated before stent implantation.

Rotational atherectomy should **not be performed** routinely for de novo or in-stent restenosis.

No Benefit

Helping Cardiovascular Professionals
Learn. Advance. Heal.

American
Heart
Association®

The Society for Cardiovascular
Angiography and Interventions

Thrombectomy

Aspiration thrombectomy is reasonable for patients undergoing primary PCI.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Laser Angioplasty

Laser angioplasty might be considered for fibrotic or moderately calcified lesions that cannot be crossed or dilated with conventional balloon angioplasty.

No Benefit

Laser angioplasty should not be used routinely during PCI.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Cutting Balloon Angioplasty

Cutting balloon angioplasty might be considered to avoid slippage-induced coronary artery trauma during PCI for in-stent restenosis or for ostial lesions in side branches.

Cutting balloon angioplasty **should not be performed** routinely during PCI.

No Benefit

Helping Cardiovascular Professionals
Learn. Advance. Heal.

American
Heart
Association®

The Society for Cardiovascular
Angiography and Interventions

Embololic Protection Devices

Cutting balloon angioplasty should not be performed routinely during PCI.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Procedural Considerations

Percutaneous Hemodynamic Support Devices

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Percutaneous Hemodynamic Support Devices

Elective insertion of an appropriate hemodynamic support device as an adjunct to PCI may be reasonable in carefully selected high-risk patients.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Oral Antiplatelet Therapy

Patients already taking daily aspirin therapy should take 81 to 325 mg prior to PCI.

Patients not on aspirin therapy should be given nonenteric aspirin 325 mg prior to PCI.

After PCI, aspirin should be continued indefinitely.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Oral Antiplatelet Therapy (cont.)

A loading dose of a P2Y₁₂ receptor inhibitor should be given to patients undergoing PCI with stenting. Options include:

- a. Clopidogrel 600 mg (ACS and non-ACS patients).
- b. Prasugrel 60 mg (ACS patients).
- c. Ticagrelor 180 mg (ACS patients).

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Oral Antiplatelet Therapy (cont.)

The loading dose of clopidogrel for patients undergoing PCI after fibrinolytic therapy should be 300 mg within 24 hours and 600 mg more than 24 hours after receiving fibrinolytic therapy.

Patients should be counseled on the need for and risks of DAPT before placement of intracoronary stents, especially a DES, and alternative therapies should be pursued if they are unwilling or unable to comply with the recommended duration of DAPT.

American
Heart
Association

The Society for Cardiovascular
Angiography and Interventions

Oral Antiplatelet Therapy (cont.)

The duration of P2Y₁₂ inhibitor therapy after stent implantation should generally be as follows:

- a) In patients receiving a stent (BMS or DES) during PCI for ACS, P2Y₁₂ inhibitor therapy should be given for at least 12 months. Options include: clopidogrel 75 mg daily, prasugrel 10 mg daily, and ticagrelor 90 mg twice daily.
- b) In patients receiving a DES for a non-ACS indication, clopidogrel 75 mg daily should be given for at least 12 months if patients are not at high risk of bleeding.
- c) In patients receiving a BMS for a non-ACS indication, clopidogrel should be given for a minimum of 1 month and ideally up to 12 months (unless the patient is at increased risk of bleeding; then it should be given for a minimum of 2 weeks).

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Oral Antiplatelet Therapy (cont.)

After PCI, it is reasonable to use 81 mg per day of aspirin in preference to higher maintenance doses.

If the risk of morbidity from bleeding outweighs the anticipated benefit afforded by a recommended duration of P2Y₁₂ inhibitor therapy after stent implantation, earlier discontinuation (e.g., <12 months) of P2Y₁₂ inhibitor therapy is reasonable.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Oral Antiplatelet Therapy (cont.)

Continuation of DAPT beyond 12 months may be considered in patients undergoing DES implantation.

Harm

Prasugrel **should not be administered** in patients with a prior history of stroke or TIA.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Intravenous Antiplatelet Therapy: STEMI

In patients undergoing primary PCI treated with UFH, it is reasonable to administer a GP IIb/IIIa inhibitor (abciximab, double-bolus eptifibatide, or high-bolus dose tirofiban), whether or not pretreated with clopidogrel.

For GP IIb/IIIa inhibitor administration in patients not pretreated with clopidogrel.

For GP IIb/IIIa inhibitor administration in patients who are pretreated with clopidogrel.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Intravenous Antiplatelet Therapy : STEMI (cont.)

In patients undergoing primary PCI with abciximab, it may be reasonable to administer intracoronary abciximab.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Intravenous Antiplatelet Therapy: STEMI (cont.)

No Benefit

Routine precatheterization laboratory (e.g., ambulance or emergency room) administration of GP IIb/IIIa inhibitors as part of an upstream strategy for patients with STEMI undergoing PCI **is not beneficial.**

*Helping Cardiovascular Professionals

Anticoagulant Therapy: Use of Parenteral Anticoagulants During PCI

An anticoagulant should be administered to patients undergoing PCI.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Anticoagulant Therapy: UFH

Administration of intravenous UFH is useful in patients undergoing PCI.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

American
Heart
Association®

The Society for Cardiovascular
Angiography and Interventions

Anticoagulant Therapy: Enoxaparin

An additional dose of 0.3 mg/kg intravenous enoxaparin should be administered at the time of PCI to patients who have received <2 therapeutic subcutaneous doses (e.g., 1 mg/kg) or received the last subcutaneous enoxaparin dose 8 to 12 hours prior to PCI.

Performance of PCI with enoxaparin may be reasonable in patients either treated with “upstream” subcutaneous enoxaparin for UA/NSTEMI or who have not received prior antithrombin therapy and are administered intravenous enoxaparin at the time of PCI.

UFH **should not be given** to patients already receiving therapeutic subcutaneous enoxaparin.

Harm

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Anticoagulant Therapy: Bivalirudin and Argatroban

For patients undergoing PCI, bivalirudin is useful as an anticoagulant with or without prior treatment with UFH.

For patients with heparin-induced thrombocytopenia, it is recommended that bivalirudin or argatroban be used to replace UFH.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Anticoagulant Therapy: Fondaparinux

Harm

Fondaparinux **should not be used** as the sole anticoagulant to support PCI. An additional anticoagulant with anti-IIa activity should be administered because of the risk of catheter thrombosis.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

No-Reflow Pharmacologic Therapies

Administration of an intracoronary vasodilator (adenosine, calcium channel blocker, or nitroprusside) is reasonable to treat PCI-related no-reflow that occurs during primary or elective PCI.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Procedural Considerations

PCI in Specific Anatomic Situations

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Chronic Total Occlusions

PCI of a CTO in patients with appropriate clinical indications and suitable anatomy is reasonable when performed by operators with appropriate expertise.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Saphenous Vein Grafts

EPDs should be used during SVG PCI when technically feasible.

Platelet GP IIb/IIIa inhibitors **are not beneficial** as adjunctive therapy during SVG PCI.

No Benefit

PCI **is not recommended** for chronic SVG occlusions.

Harm

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Bifurcation Lesions

Provisional side-branch stenting should be the initial approach in patients with bifurcation lesions when the side branch is not large and has only mild or moderate focal disease at the ostium.

It is reasonable to use elective double stenting in patients with complex bifurcation morphology involving a large side branch where the risk of side-branch occlusion is high and the likelihood of successful side-branch reaccess is low.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Aorto-Ostial Stenosis

IVUS is reasonable for the assessment of angiographically-indeterminant left main CAD.

Use of DES is reasonable when PCI is indicated in patients with an aorto-ostial stenosis.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Calcified Lesions

Rotational atherectomy is reasonable for fibrotic or heavily calcified lesions that might not be crossed by a balloon catheter or adequately dilated before stent implantation.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Procedural Considerations

PCI in Specific Patient Populations

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Chronic Kidney Disease

In patients undergoing PCI, the glomerular filtration rate should be estimated and the dosage of renally-cleared medications should be adjusted.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Periprocedural Myocardial Infarction Assessment

In patients who have signs or symptoms suggestive of MI during or after PCI, or in asymptomatic patients with significant *persistent* angiographic complications (e.g., large side-branch occlusion, flow limiting dissection, no-reflow phenomenon or coronary thrombosis), creatinine kinase-MB and troponin I or T should be measured.

Helping Cardiovascular Professionals

American
Heart
Association®

The Society for Cardiovascular
Angiography and Interventions

Periprocedural Myocardial Infarction Assessment (cont.)

Routine measurement of cardiac biomarkers (creatinine kinase-MB and/or troponin I or T) in all patients post-PCI may be reasonable.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Vascular Closure Devices

Patients considered for vascular closure devices should undergo a femoral angiogram to ensure anatomic suitability for deployment.

The use of vascular closure devices is reasonable for the purposes of achieving faster hemostasis and earlier ambulation compared with the use of manual compression.

No Benefit

The routine use of vascular closure devices **is not recommended** for the purpose of decreasing vascular complications, including bleeding.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Postprocedural Considerations

Postprocedural Antiplatelet Therapy

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Postprocedural Antiplatelet Therapy

After PCI, aspirin should be continued indefinitely.

The duration of P2Y₁₂ inhibitor therapy after stent implantation should generally be as follows:

- a) In patients receiving a stent (BMS or DES) during PCI for ACS, P2Y₁₂ inhibitor therapy should be given for at least 12 months (clopidogrel 75 mg daily); prasugrel 10 mg daily; and ticagrelor 90 mg twice daily.
- b) In patients receiving a DES for a non-ACS indication, clopidogrel 75 mg daily should be given for at least 12 months if patients are not at high risk of bleeding.
- c) In patients receiving a BMS for a non-ACS indication, clopidogrel should be given for a minimum of 1 month and ideally up to 12 months (unless the patient is at increased risk of bleeding; then it should be given for a minimum of 2 weeks).

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Postprocedural Antiplatelet Therapy (cont.)

Patients should be counseled on the importance of compliance with DAPT, and that therapy should not be discontinued before discussion with the relevant cardiologist.

After PCI, it is reasonable to use 81 mg per day of aspirin in preference to higher maintenance doses.

If the risk of morbidity from bleeding outweighs the anticipated benefit afforded by a recommended duration of P2Y₁₂ inhibitor therapy after stent implantation, earlier discontinuation (e.g., >12 months) of P2Y₁₂ inhibitor therapy is reasonable.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Postprocedural Antiplatelet Therapy (cont.)

Continuation of clopidogrel, prasugrel or ticagrelor beyond 12 months may be considered in patients undergoing DES placement.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Postprocedural Considerations

Proton Pump Inhibitors and Antiplatelet Therapy

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

PPIs and Antiplatelet Therapy

PPI should be used in patients with history of prior GI who require DAPT.

PPI use is reasonable in patients with increased risk of gastrointestinal bleeding (advanced age, concomitant use of warfarin, steroids, nonsteroidal anti-inflammatory drugs, H pylori infection, etc.) who require DAPT.

No Benefit

Routine use of a PPI **is not recommended** for patients at low risk of gastrointestinal bleeding, who have much less potential to benefit from prophylactic therapy.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Clopidogrel Genetic Testing

Genetic testing might be considered to identify whether a patient at high risk for poor clinical outcomes is predisposed to inadequate platelet inhibition with clopidogrel.

When a patient predisposed to inadequate platelet inhibition with clopidogrel is identified by genetic testing, treatment with an alternate P2Y₁₂ inhibitor (e.g., prasugrel or ticagrelor) might be considered.

No Benefit

The routine clinical use of genetic testing to screen clopidogrel-treated patients undergoing PCI **is not recommended.**

Helping Cardiovascular Professionals
Learn. Advance. Heal.

American
Heart
Association

The Society for Cardiovascular
Angiography and Interventions

Platelet Function Testing

Platelet function testing may be considered in patients at high risk for poor clinical outcomes.

In clopidogrel-treated patients with high platelet reactivity, alternative agents, such as prasugrel or ticagrelor, might be considered.

No Benefit

The routine clinical use of platelet function testing to screen clopidogrel-treated patients undergoing PCI **is not recommended.**

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Restenosis

Patients who develop clinical restenosis after balloon angioplasty should be treated with BMS or DES if anatomic factors are appropriate and if the patient is able to comply with and tolerate DAPT.

Patients who develop clinical restenosis after BMS should be treated with DES if anatomic factors are appropriate and the patient is able to comply with and tolerate DAPT.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

American
Heart
Association®

The Society for Cardiovascular
Angiography and Interventions

Restenosis (cont.)

IVUS is reasonable to determine the mechanism of stent restenosis.

Patients who develop clinical restenosis after DES may be considered for repeat PCI with balloon angioplasty, BMS, or DES containing the same drug or an alternative antiproliferative drug if anatomic factors are appropriate and patient is able to comply with and tolerate DAPT.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Exercise Testing

In patients entering a formal cardiac rehabilitation program after PCI, treadmill exercise testing is reasonable.

Routine, periodic stress testing of asymptomatic patients after PCI without specific clinical indications **should not be performed.**

No Benefit

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Cardiac Rehabilitation

Medically-supervised exercise programs (cardiac rehabilitation) should be recommended to patients after PCI, particularly for moderate- to high-risk patients for whom supervised exercise training is warranted.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Quality and Performance Considerations

Quality and Performance

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Quality and Performance

Every PCI program should operate a quality improvement program that routinely: a) reviews quality and outcomes of the entire program; b) reviews results of individual operators; c) includes risk adjustment; d) provides peer review of difficult or complicated cases, and; e) performs random case reviews.

Every PCI program should participate in a regional or national PCI registry for the purpose of benchmarking its outcomes against current national norms.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Certification and Maintenance of Certification

It is reasonable for all physicians that perform PCI to participate in the American Board of Internal Medicine interventional cardiology board certification and maintenance of certification program.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Operator and Institutional Competency and Volume

Elective/urgent PCI should be performed by operators with acceptable annual volume (≥ 75 procedures) at high-volume centers (>400 procedures) with onsite cardiac surgery.

Elective/urgent PCI should be performed by operators and institutions whose current risk-adjusted outcomes statistics are comparable to those reported in contemporary national data registries.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Operator and Institutional Competency and Volume (cont.)

Primary PCI for STEMI should be performed by experienced operators who perform more than 75 elective PCI procedures per year and, ideally, at least 11 PCI procedures for STEMI per year. Ideally, these procedures should be performed in institutions that perform more than 400 elective PCIs per year and more than 36 primary PCI procedures for STEMI per year.

It is reasonable that operators with acceptable volume (≥ 75 PCI procedures per year) perform elective/urgent PCI at low-volume centers (200 to 400 PCI procedures per year) with onsite cardiac surgery.

Helping Cardiovascular Professionals
Learn. Advance. Heal.

Operator and Institutional Competency and Volume (cont.)

It is reasonable that low-volume operators (<75 PCI procedures per year) perform elective/urgent PCI at high-volume centers (>400 PCI procedures per year) with onsite cardiac surgery. Ideally, operators with an annual procedure volume <75 should only work at institutions with an activity level of more than 600 procedures per year. Operators who perform <75 procedures per year should develop a defined mentoring relationship with a highly experienced operator who has an annual procedural volume of at least 150 procedures per year.

*Helping Cardiovascular Professionals
Learn. Advance. Heal.*

Operator and Institutional Competency and Volume (cont.)

The benefit of primary PCI for STEMI patients eligible for fibrinolysis when performed by an operator who performs <75 procedures per year (<11 PCIs for STEMI per year) is not well established.

No Benefit

It **is not recommended** that elective/urgent PCI be performed by low-volume operators (<75 procedures per year) at low-volume centers (200 to 400 procedures per year) with or without onsite cardiac surgery. An institution with a volume of <200 procedures per year, unless in a region that is underserved because of geography, should carefully consider whether it should continue to offer this service.

Helping Cardiovascular Professionals
